An annotated list of new records of butterflies and moths of Severodonetsk is provided. The list includes 425 species registered in Severodonetsk for the first time, 190 species of which are new records for Luhansk Region, and 1 species (*Ethmia vittalabella* (Christoph, 1877)) is new for Ukraine. Totally, there are 1,074 species of Lepidoptera registered in Severodonetsk.

Introduction. Previously data on Lepidoptera of Severodonetsk and its environs appeared in the publications shown in Table 1. We exclude three species, *Scopula nemoraria* (Hübner, [1799]), *Cidaria fulvata* (Forster, 1771) (Demyanenko, Severov, Kostjuk, 2011) and *Sciota hostilis* (Stephens, 1834) (Demyanenko, 2019), from the list of Severodonetsk and Lugansk region due to misidentification of *Scopula floslactata* (Haworth, [1809]), *Eulithis mellinata* (Fabricius, 1787) and *Apomyelois bistriatella* (Hulst, 1887) respectively. Totally, 649 species of Lepidoptera were known from Severodonetsk prior to this work.

Materials and methods. This paper is based on the material collected and observed by the first author (otherwise the name of collector is indicated) in Severodonetsk and its close environs since 1996.

The material was observed, photographed, and collected by netting during daytime excursions, attracting by light (160 W and 250 W mercury-vapor lamps), and in some cases by attracting by wine lure.

The determination of the material was carried out by the authors. The identification by photographs was made only for species with distinct differences in habitus. In difficult cases, the determination was made by genitalia prepared by maceration in 8–12% NaOH solution. Determination of mines were made by Ellis (2021) and Lepiforum (2020). Plant names are given by 'Plants of the World Online' (POWO, 2021).

The material is stored in the collections of the Institute for Evolutionary Ecology of the National Academy of Sciences of Ukraine (Kyiv) and the Museum of Nature of the Vasyl Karazin Kharkiv National University.

The main place for attracting by light is 5 km S Severodonetsk, 'dacha' area (48.904°N, 38.509°E), further in text 'D' (in 2007–2012 we used mercury-fluorescent 250 W arc lamp, in 2013–2016 — mercury-tungsten 250 W arc lamp, after 2016 — mercury-tungsten 160 W arc lamp, unless stated otherwise). Besides this, we recorded a few specimens of Lepidoptera attracted by incandescent and LED lamps within the city (48.934°N, 38.494°E), further in text 'C'. In addition, single specimens in both of the above-mentioned locations were registered in the daytime (in such cases it is indicated in the text).

Daytime excursions were made to the **floodplain forest area** (mainly oak-maple) SW Severodonetsk (48.91°N, 38.47–38.50°E) — further in text ‘L’, and to **sandy-steppe areas in the pine forest** (with alder-birch forests and oak plantings) SE, NE, and N of Severodonetsk (48.91–48.92°N and 38.49–38.65°E, 48.95–48.97°N and 38.54–38.60°E, 49.00–49.02°N and 38.49–38.52°E), — further in text ‘P’.

In the list below all species are new for Severodonetsk, an asterisk (*) indicates a species new for Luhansk Region; two asterisks (**) — a species new for Ukraine. For the species new for Ukraine, its general distribution is given.

The higher system of Lepidoptera follows Nieuwerkerken *et al.* (2011) with corrections from Heikkilä *et al.* (2014).

Conclusions. According to the results of our research and the literature data, 1,074 species of Lepidoptera are found in Severodonetsk and its environs, 425 of which are given for the first time, 190 of which are new records for Luhansk Region, and one is new for Ukraine. At the same time, the list of Lepidoptera of Severodonetsk is still not complete and further studies will certainly supplement it with new species.
